

## Now You Know Everything They Know.

Have you ever wondered what EQ was used on that best selling CD you like so much? Or maybe you are having some trouble getting your mix to sound like the one you keep around as your "best mix I ever heard" reference. Or perhaps you just don't have an extra three hours to match your new guitar punch-in to that great six month old original take.

Have you ever wished that you could just make one mix *sound* like another?

To successfully match two songs (or even two takes) requires a complete knowledge of both the original material's energy distribution and that of the new material, along with extensive experience in the *correct* use of Finite Impulse Response equalization. And then there's the time it takes to actually do the hand matching!

You knew the day would come when computer based audio technology would advance to the point that you could *buy* knowledge and experience, didn't you? Perhaps you imagined a breakthrough that would make it possible to literally *own* a virtual assistant; a second engineer who would gladly perform those difficult and time consuming tasks like "reverse engineering" the total EQ of any track or song, and then applying its "sound" to *your* material. Or perhaps he could check each of your mixes to see if their total spectral energy is what you want for your target market. Or maybe he could help you with some film dialog matching. And what if he could do a full day's work in half an hour? Well...

That day has arrived! Intelligent Devices brings you its new intelligent agent; **I.Q.**
